

Mobile safety railing at the truck tanker filling points

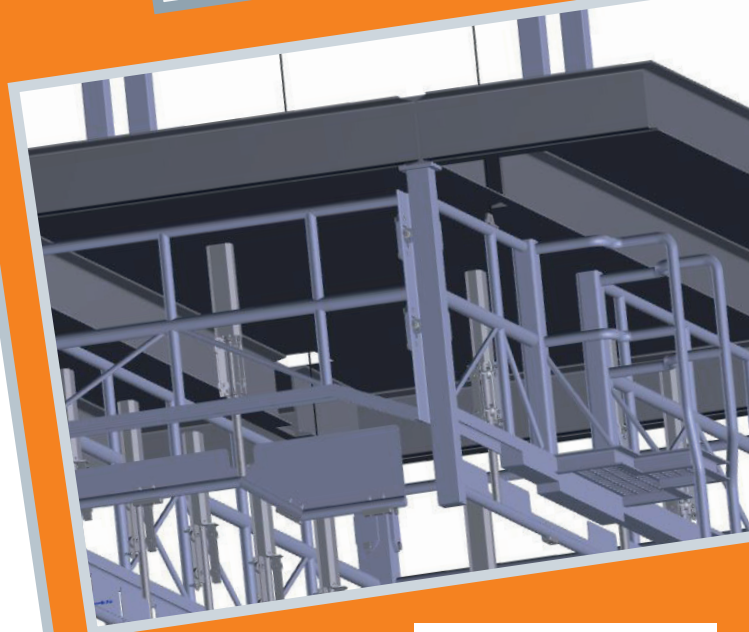

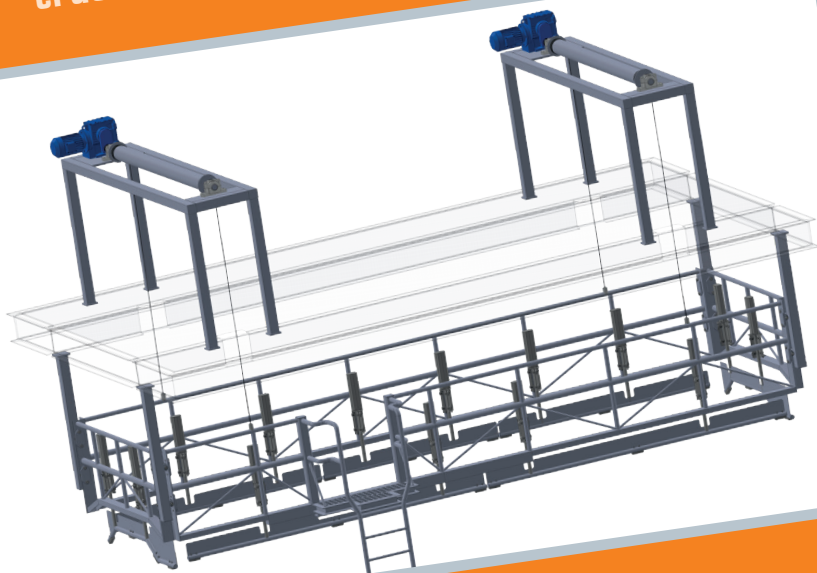

The safety railing was designed to protect the operators during handling of the filling spout where the operator moves on the surface of the tanker to ensure a tight fit of the filling spout on the filling mouth of the tanker. The mobile safety railing (MSR) prevents the tanker operators from falling. The MSR design takes into consideration the necessary legislation on machinery safety, access to machinery, temporary protection of open ends and safety railings. The MSR ranks among the modern OSH elements and thanks to it the operators of the tanker filling technologies have a further option to increase the safety of their own workers and the workers of forwarding companies which transport bulk materials from the plant.
